ACKNOWLEDGEMENT

We extend our sincere appreciation to Dr. Bidur Devkota, our project supervisor, for his invaluable advice and guidance throughout the project's development. Our sincere gratitude goes to Dr Bishwo Udhir Poudel Gharti, the principal, and Mr. Ashok Raj Parajuli, the vice principal, for granting us the opportunity to enhance our skills and supporting us in bringing the project to fruition. We also want to express our thanks to the entire supervisory team for their unwavering assistance in resolving the various challenges we encountered during the project.

Special thanks to Dr. Bidur Devkota, the Head of the Project Department, for his guidance and support. Additionally, we are thankful to our friends, with whom we have collaboratively discuss about the problems and found solutions over the past few months. Lastly, we appreciate the library staff for their invaluable assistance in providing research materials and valuable suggestions. The entire team is profoundly grateful to all those who contributed to the successful development of MerchVault.

ABSTRACT

MerchVault is an e-commerce platform that offers both pre-made and user-customized goods, providing a simple and user-friendly experience. The platform allows customers to explore and purchase variety of products, including apparel, artworks, and decorations. One of its key features is the ability for users to customize these products by adding their own designs, making each item unique their personal style. MerchVault also promotes artist collaboration, enabling artists to contribute fresh and creative designs. This collaboration encourages user engagement, creating a dynamic community of shoppers and designers. MerchVault aims to become a go-to platform for those looking for distinctive and personalized products.

Keywords: E-commerce, User-customized goods, Artist collaboration, User engagement.

CHAPTER 1

INTRODUCTION

1.1 BACKGROUND

In the current internet age, e-commerce has become a major part of people's lives. Traditional shopping methods are gradually being replaced by the convenience and efficiency of online shopping. This trend is increasingly evident in Nepal, where more individuals are turning to online shopping for its time-saving benefits. Online shopping in Nepal is becoming the new trend. (Bhatta, 2024).

People value having products that are unique to them. Shopping is not just about fulfilling needs; it's also about creating an emotional connection during the purchasing process. When people can add their own touch to things online, they are more likely to stick around and keep coming back. (Towey, 2023).

This is where MerchVault comes in. MerchVault is a web application that not only offers a variety of pre-made products but also allows users to customize and personalize their items. By adding their own designs, users can make products uniquely their own, encouraging self-expression and creativity. Additionally, MerchVault creates opportunities for artists to showcase and sell their designs, providing them with a potential source of income.

1.2 PROBLEM STATEMENT

Traditional commerce platforms provide extensive catalogs of products, but navigating these can be overwhelming for users looking for items that align with their preferences and styles. Additionally, physical stores face space constraints, limiting the number of items they can stock. (Khan, 2022). In this context, online shopping or e-commerce appears as a highly beneficial alternative. However, even within the realm of online shopping, users still encounter challenges when trying to find desired items. Personalized items present a potential solution to this issue. What is needed is a user-friendly application that makes shopping enjoyable while providing the option to customize products to meet individual tastes.

1.3 OBJECTIVES

To create an e-commerce web application with the following features:

- Enable users to customize their products.
- Provide a platform for artists to submit and showcase their designs.

1.4 IMPLICATION

The MerchVault project aims to make online shopping easier and more enjoyable by helping users browse and buy products quickly. It lets users create and customize their own product designs, which makes shopping more personal and fun. This customization helps users feel more connected to the items they buy. MerchVault also gives artists a place to show their work, building a strong community of creativity and support. This project can help keep users coming back, reach a wider audience, and create a supportive space where shoppers and artists connect and grow together.

CHAPTER 2

LITERATURE REVIEW

There are many applications that we have found that have similar functionalities to MerchVault. But there are some features we think will differentiate MerchVault from other sites. Following are some of them:

Atsuko:

Atsuko is a global e-commerce platform specializing in anime and pop culture merchandise. It offers a wide variety of products including apparel, accessories, and home decor items featuring popular anime characters and themes. While Atsuko primarily offers pre-designed merchandise, it has limited customization options for end-users. (Atsuko, 2018).

Seto Canvas:

Seto Canvas is a Nepal-based platform that allows creative individuals to sell their artwork printed on various merchandise items such as T-shirts, sweatshirts, mugs, and wall frames. It is designed to empower local artists and provide them with a platform to monetize their creativity. (Canvas, 2020).

Displate:

Displate is a platform that specializes in pop culture posters, offering a variety of metallic posters and allowing users to create their own designs. While Displate provides an opportunity for users to publish and monetize their designs, it is limited to poster products (Displate, 2013).

GoCustomClothing:

GoCustomClothing is a platform that allows users to order clothing with their own designs. GoCustomClothing has a simple goal – to offer an extensive range of garments which customers can print and embroider their logos or design quickly and easily. (About Us| GoCustomClothing, 2024)

TShirt Studio:

TShirt Studio is a platform that allows users to order shirts with both pre-made and custom designs. However, it only allows customization for shirts and does not offer users the ability to monetize their designs. (About Us | TShirt Studio, 2024)

The following is the table comparing the features of all the web applications mentioned earlier including **MerchVault**:

Table 2.1: Comparison Table

Web Applications	Product Customization	Product Rating and Review	Artist Collaborations	Product Diversity
Atsuko	Allows no product customization.	Allows users to rate and write reviews.	Does not collaborate with artists. Provides only products.	Provides a diverse catalog from clothing to decorations.
Seto Canvas	Allows no product customization.	Does not allow rating and reviews.	Collaborates with artists.	Provides only clothing items and posters.
Displate	Allows custom designs.	Allows users to rate products but does not allow reviews.	Collaborates with artists as well as big name brands.	Provides metal posters only.
GoCustomClothing	Allows custom graphics and embroiders.	Does not allow any rating of any kind.	Does not collaborate with any artists.	Provides wide range of clothes.
TShirt Studio	Allows custom graphics to be applied.	Allows both ratings and reviews.	Does not collaborate with artists.	Provides clothing items only.

MerchVault	Will allow users to customize products.	Will allow users to rate and write reviews of products.	Will collaborate with artists.	Will provide a wide catalog of products.
------------	---	---	--------------------------------	--

Each platform mentioned above offers some of these features, but none offers all of them comprehensively. Our project does not aim to introduce entirely new features; instead, it aims to integrate all of these existing features into a single platform.

CHAPTER 3

TOOLS AND METHODOLOGY

3.1 TOOLS

The following tools will be used for the development of the system:

- **JSX, CSS, React.js, Node.js:** These languages and frameworks will be utilized for the coding and implementation of the system.
- **MongoDB:** A NoSQL database used for storing and managing application data.
- **Mongoose:** An Object Data Modeling (ODM) library for MongoDB, used for schema design and database interaction.
- **Visual Studio Code:** This will be used as the main code editor for writing and managing code.
- **Google Chrome:** This browser will be used for viewing the output and debugging the application.
- **Express.js:** This framework will be employed for building the server-side logic.
- **GitHub:** This platform will be used for version control and project management.
- **Postman:** This tool will be utilized for testing APIs.
- **DIA:** This tool will be used for illustrating UML diagrams.

3.2 DATABASE DETAILS

For data storage and management, **MongoDB** has been utilized in the MerchVault system. MongoDB is a NoSQL database that provides flexibility in handling unstructured data and offers scalability, making it an ideal choice for this e-commerce platform. The system uses MongoDB to store and retrieve various data types such as user information, product details, order status, and user-submitted design. MongoDB integrates with the **Node.js backend** via **Mongoose**, providing a seamless interface for querying and managing the data.

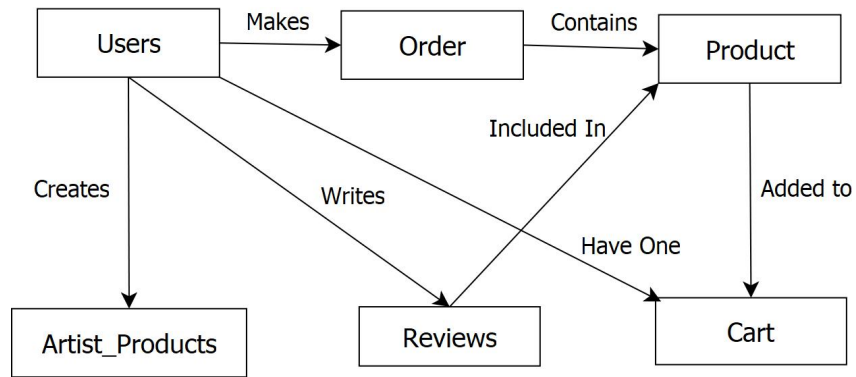

Figure 3.2.1: Block Diagram of Database Collections

3.2.1 DATABASE SCHEMA

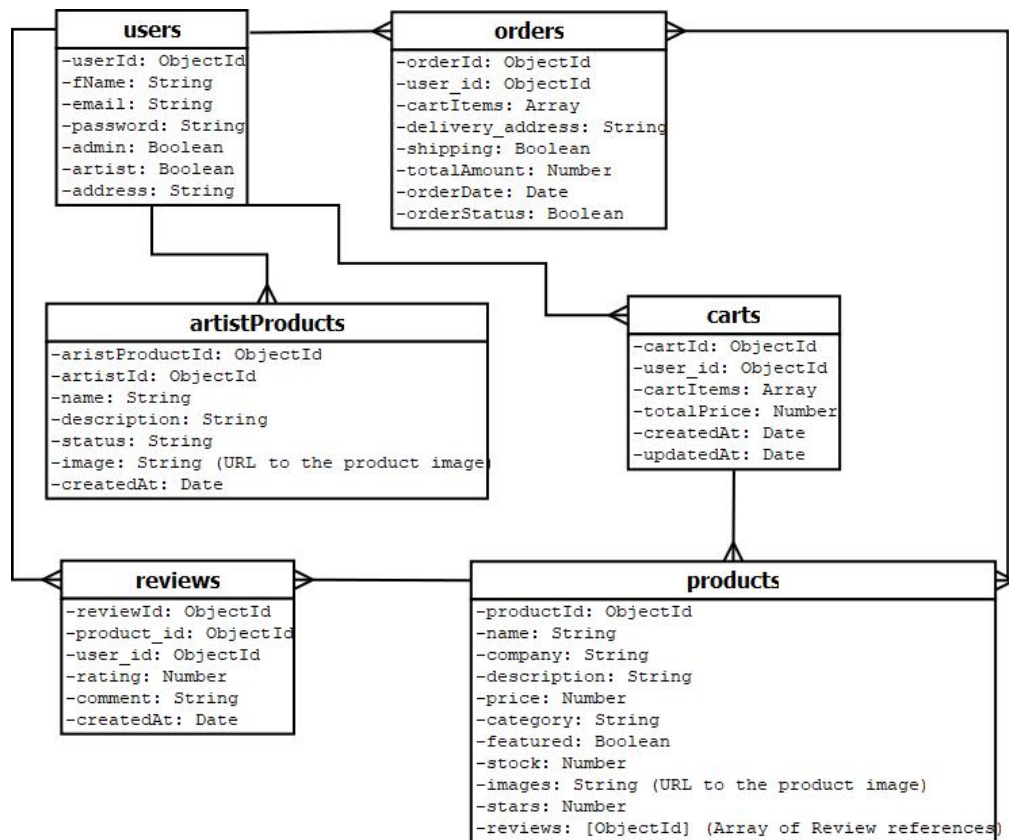

Figure 3.2.1.1: Database Schema of MerchVault

The database schema of MerchVault is designed to efficiently organize and manage data for the e-commerce platform. It incorporates multiple collections that support the functionality of the platform, including user management, product customization, order tracking, and artist contributions.

Below are the collections, their descriptions, and key fields:

1. ArtistProducts

This collection stores designs submitted by artists for review and approval. Approved designs are available for customers to customize products.

- **Key Fields:**

- artistProductId: Unique identifier for the artist's product.
- artistId: Refers to the artist submitting the product.
- name: Name of the design/product.
- description: Description of the design/product.
- status: Approval status (e.g., Pending, Approved, Rejected).
- image: URL of the product image.
- createdAt: Date when the product was created.

2. Carts

This collection tracks the contents of a user's shopping cart, including selected products and their quantities.

- **Key Fields:**

- cartId: Unique identifier for the cart.
- userId: Refers to the user owning the cart.
- cartItems: List of products with quantities (e.g., { productId, quantity }).
- totalPrice: Total price of the items in the cart.
- createdAt: Date when the cart was created.
- updatedAt: Date when the cart was last updated.

3. Orders

This collection records user orders, including order details, payment status, and shipping information.

- **Key Fields:**

- orderId: Unique identifier for the order.
- userId: Refers to the user who placed the order.
- cartItems: List of ordered products with quantities.

- totalAmount: Total price of the order.
- shipping: Shipping status.
- orderStatus: Order status (e.g., Pending, Shipped, Delivered, Cancelled).
- orderDate: Date when the order was placed.
- deliveryAddress: Address object for delivery (e.g., street, city, postal code).

4. Products

This collection stores details of all approved products available for purchase on the platform.

- **Key Fields:**

- productId: Unique identifier for the product.
- name: Name of the product.
- company: Brand or company of the product.
- description: Description of the product.
- price: Price of the product.
- category: Category (e.g., T-Shirts, Posters).
- featured: Indicates if the product is featured.
- stock: Quantity available.
- images: URLs of product images.
- stars: Overall rating of the product.
- reviews: Count or list of reviews for the product.

5. Reviews

This collection stores user feedback for products.

- **Key Fields:**

- reviewId: Unique identifier for the review.
- productId: Refers to the reviewed product.
- userId: Refers to the reviewer.
- rating: User-provided rating (e.g., 1–5).
- comment: Feedback text.
- createdAt: Date when the review was submitted.

6. Users

This collection manages user data, roles, and account information.

- **Key Fields:**
 - `userId`: Unique identifier for the user.
 - `fName`: Full name of the user.
 - `address`: User's address details.
 - `email`: Email address.
 - `password`: Secure hashed password.
 - `admin`: Role status as Admin.
 - `artist`: Role status as Artist.

3.3 METHODOLOGY

The development model that our project will be using is a combination of waterfall and iterative-incremental models. The waterfall model is a linear, sequential approach to the software development life cycle (SDLC) that is popular in software engineering and product development. The waterfall model uses a logical progression of SDLC steps for a project, similar to the direction water flows over the edge of a cliff. It sets distinct endpoints or goals for each phase of development. Those endpoints or goals can't be revisited after their completion. (Lutkevich, 2006).

The procedure we employed included most of the phases of the waterfall model, such as requirement analysis, design, coding, implementation, and testing. However, we incorporated elements of an iterative-incremental model because we believed that our initial project concept was preliminary, allowing room for potential concept changes in the future. This approach enabled us to seamlessly accommodate new features or explore alternative techniques for implementing existing features without encountering developmental challenges.

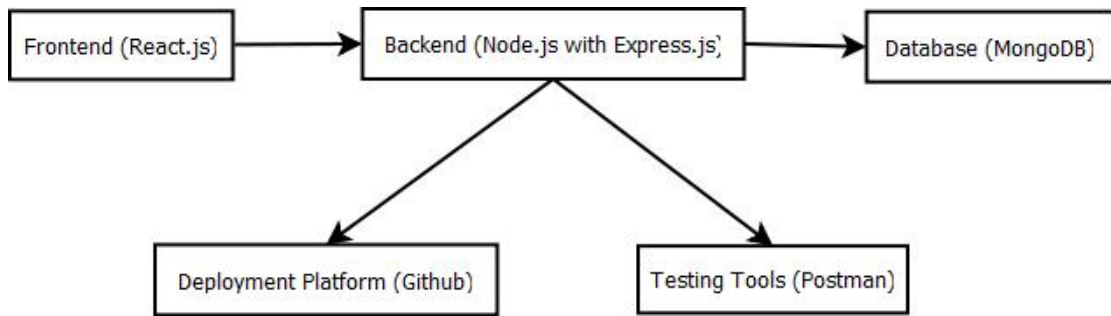

Figure 3.3.1 : Block Diagram of System Architecture

This block diagram illustrates the core components and their interactions in the MerchVault system. The diagram is designed to provide a high-level overview of the architecture, focusing on the relationship between the frontend, backend, and database.

- **Frontend (React.js, CSS):** The user interface is built using React.js and styled with CSS. It handles user interactions, displays product listings, and facilitates customization.
- **Backend (Node.js, Express.js):** The server-side logic is powered by Node.js with Express.js. It manages API requests, user authentication, and communicates with the database.
- **Database (MongoDB):** MongoDB stores critical data, including user profiles, product details, order information, and customized designs. The backend interacts with the database to perform CRUD operations.
- **Testing Tool (Postman):** Postman is used for testing the API endpoints, ensuring that the backend services are functioning as expected, and verifying the correctness of data exchanged between the frontend and backend.
- **Version Control (GitHub):** GitHub is employed for version control, allowing the development team to collaborate, track changes in the code, and manage project updates effectively.

3.4 DESIGN

3.4.1 USE CASE DIAGRAM

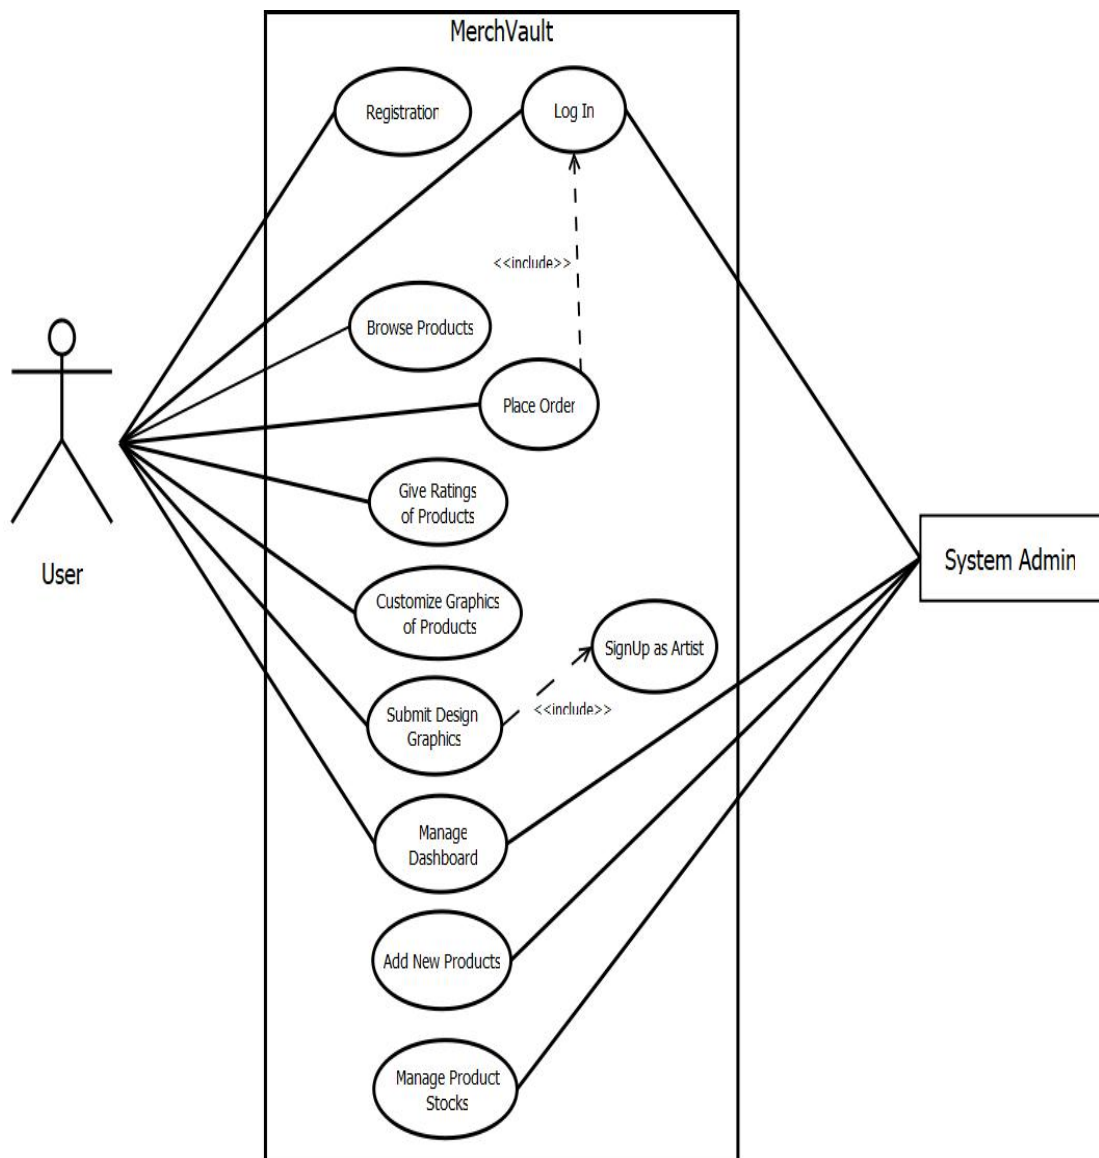

Figure 3.4.1.1 : Use Case Diagram for MerchVault

This use case diagram illustrates the primary actions users can perform in MerchVault, such as placing orders, customizing products, and submitting designs.

Use Case UC 1: Place an Order

Primary Actor: User

Pre-Condition:

- The user is logged into the system.
- The system displays the collection of products available for purchase.

Post-Condition:

- The selected product is added to the cart, and purchased successfully.
- A success message is shown to the user.

Main Success Scenario:

1. The system displays a collection of product items.
2. The user selects desired items and adds them to the cart.
3. The system checks the availability of the selected products.
4. If the products are available, they are added to the user's cart.
5. The user then selects a payment method and proceeds with the payment.
6. The system verifies the payment, creates an order, and shows a success message to the user.

Alternative Scenario:

- 3a. If the selected product is not available, the system notifies the user and suggests alternatives or prompts the user to select another product.

Use Case UC 2: Customize the Graphics of the Product

Primary Actor: User

Pre-Condition:

- The user must be logged into the system.
- The system must have a collection of images/graphics available for products customization.
- The system must support uploading and displaying of user-provided graphics in acceptable formats.

Post-Condition:

- A new customized product is created.
- The user receives a success message and a confirmation email with the details of the customized product.

Main Success Scenario:

1. The system displays a product customization page.
2. The user browses the list of products available for customization and selects the desired one.
3. The system shows a collection of pre-designed graphics for the products and provides an option for the user to upload their own graphics.
4. If the user chooses to use personal graphics, the user selects the "Upload Your Image" option and clicks the upload button.
5. The user uploads their own image and positions them on the selected product for customization.
6. Once the customization is complete, the user clicks the "Finish Customization" button.
7. The system creates the customized product, sends a success message, and emails a confirmation with details of the customized product to the user.

Alternative Scenario:

- 3a. The user chooses from the available pre-designed graphics and applies them to the product.

Use Case UC 3: Give Rating/Review of Products

Primary Actor: User

Pre-Condition:

- The user must be logged into the system.
- The system must displays a collection of products available for review and rating.

Post-Condition:

- The product's rating and review is successfully updated in the database.
- The overall rating of the product is recalculated and reflected on the product page.

Main Success Scenario:

1. The system displays a collection of product items on the product page.
2. The user selects desired items and click on the product icon.
3. The system opens a page specific to the selected product.
4. The product page contains a section where the user can provide a rating (1-5 stars) and write a review (optional).
5. The user rates the product and writes their review, then clicks the "Submit" button.
6. The system updates the product's rating and review in the database and returns a success message to the user.
7. The product's overall rating is recalculated and review is displayed on the selected product page.

Alternative Scenario:

- 5a. If there is an error in submitting the review, the system notifies the user and prompts them to try again.
- 6a. If the system fails to update the database, it notifies the user of the failure and the review is not saved.

Use Case UC 4: Sign Up as Artist

Primary Actor: User

Pre-Condition:

- The user must be logged into the system or create a user account.
- The system must show the form to allow user to sign up as artists.

Post-Condition:

- The user is successfully signed up as an artist, and a success message is displayed.
- The system grants the user access to the artist dashboard where they can submit product designs.

Main Success Scenario:

1. The user logs into the system and navigates to the "Sign Up as an Artist" section.
2. The system displays a form asking for additional details such as artist name, email, description/bio , etc.
3. The user fills out the required information and clicks the "Submit" button.
4. The system validates the information and signs the user up as an artist.
5. The system displays a success message and redirects the user to the artist dashboard where they can now submit product designs.

Alternative Scenario:

- 3a. If the user submits incomplete or invalid information, the system prompts them to correct the errors before proceeding.
- 4a. If the system encounters an error while signing up the user as an artist (e.g., database failure), it displays an error message, and the process is halted.

Use Case UC 5: Submit Product Graphics

Primary Actor: User

Pre-Condition:

- The artist must be logged into the system and have signed up as an artist.
- The artist must have access to the product submission page.

Post-Condition:

- The artist's product graphics are successfully submitted and saved in the system.
- The system notifies the artist by displaying the design on the artist's design list, pending admin approval.

Main Success Scenario:

- The artist logs into the system and navigates to the "Submit Product Graphics" page.
- The system displays a form allowing the artist to upload images, name the product, and provide a description.
- The artist uploads the product graphics, enters the required details (name, description), and clicks the "Submit" button.
- The system validates the information and uploads the graphics to the server.
- The system displays a success message, notifying the artist that the product graphics were submitted successfully and are pending admin approval..

Alternative Scenario:

- 4a. If the system fails to upload the artist's graphics (e.g., server failure), it notifies the artist of the issue, and the submission fails.

3.4.2 SYSTEM SEQUENCE DIAGRAM

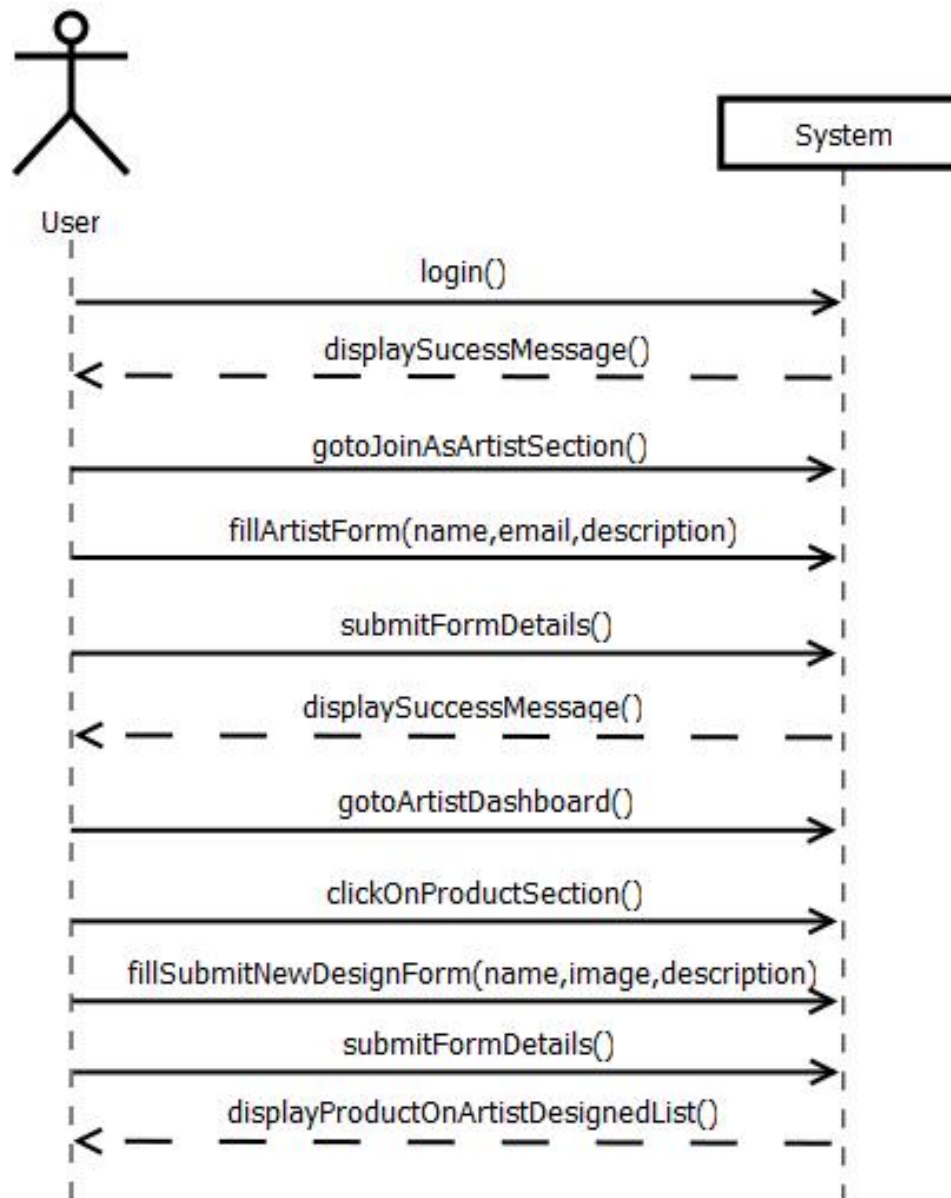

Figure 3.4.2.1: System Sequence Diagram for Artist Design Submission

This diagram shows the sequence of events that occur when an artist submits a new design. It demonstrates the interaction between the artist and the system.

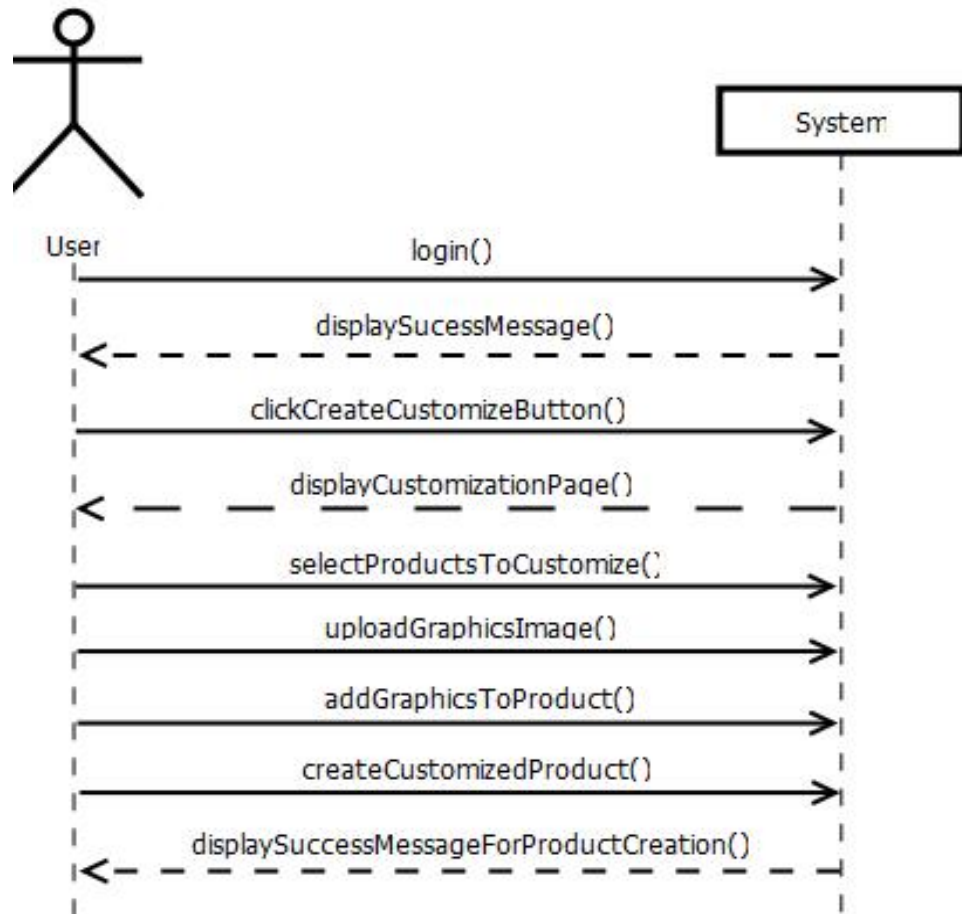

Figure 3.4.2.2: System Sequence Diagram for Product Customization

This diagram illustrates the step-by-step process for a customer customizing a product. It highlights how the system allows the upload of personal graphics or selection of pre-designed graphics for customization.

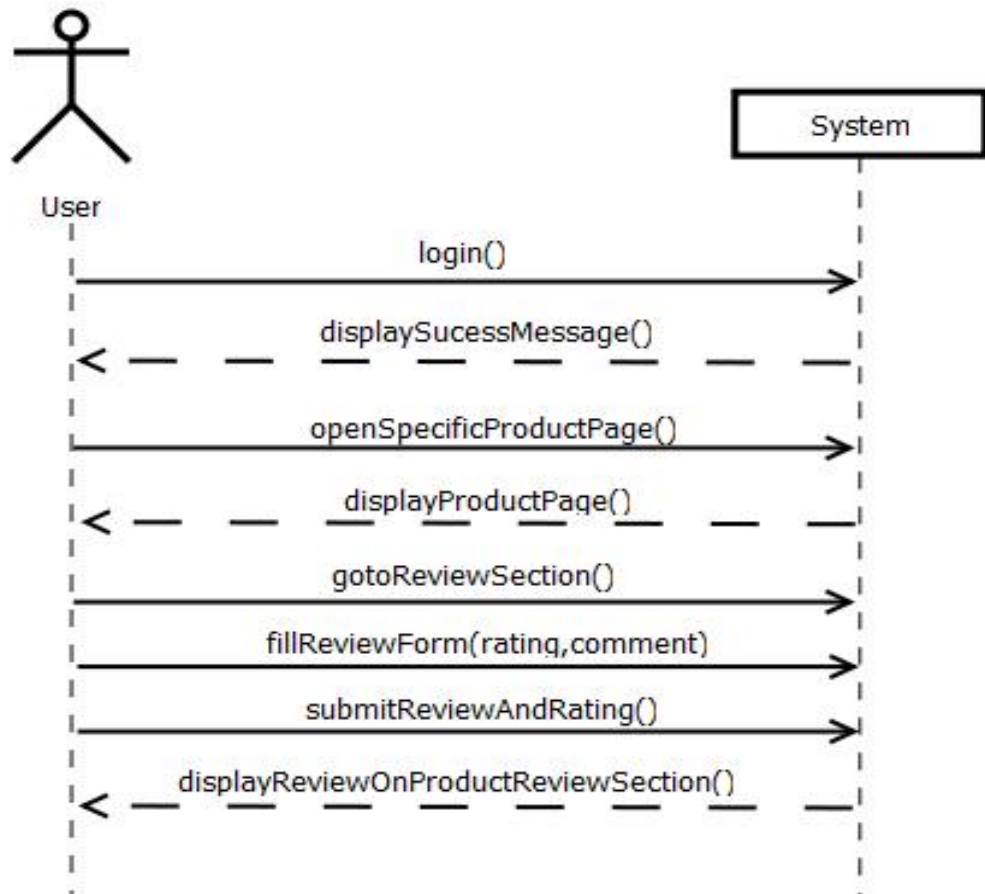

Figure 3.4.2.3: System Sequence Diagram for Product Rating and Reviewing

This sequence diagram details the process where a user rates and reviews a product. It outlines the actions from selecting a product, submitting a rating, and writing a review to the products.

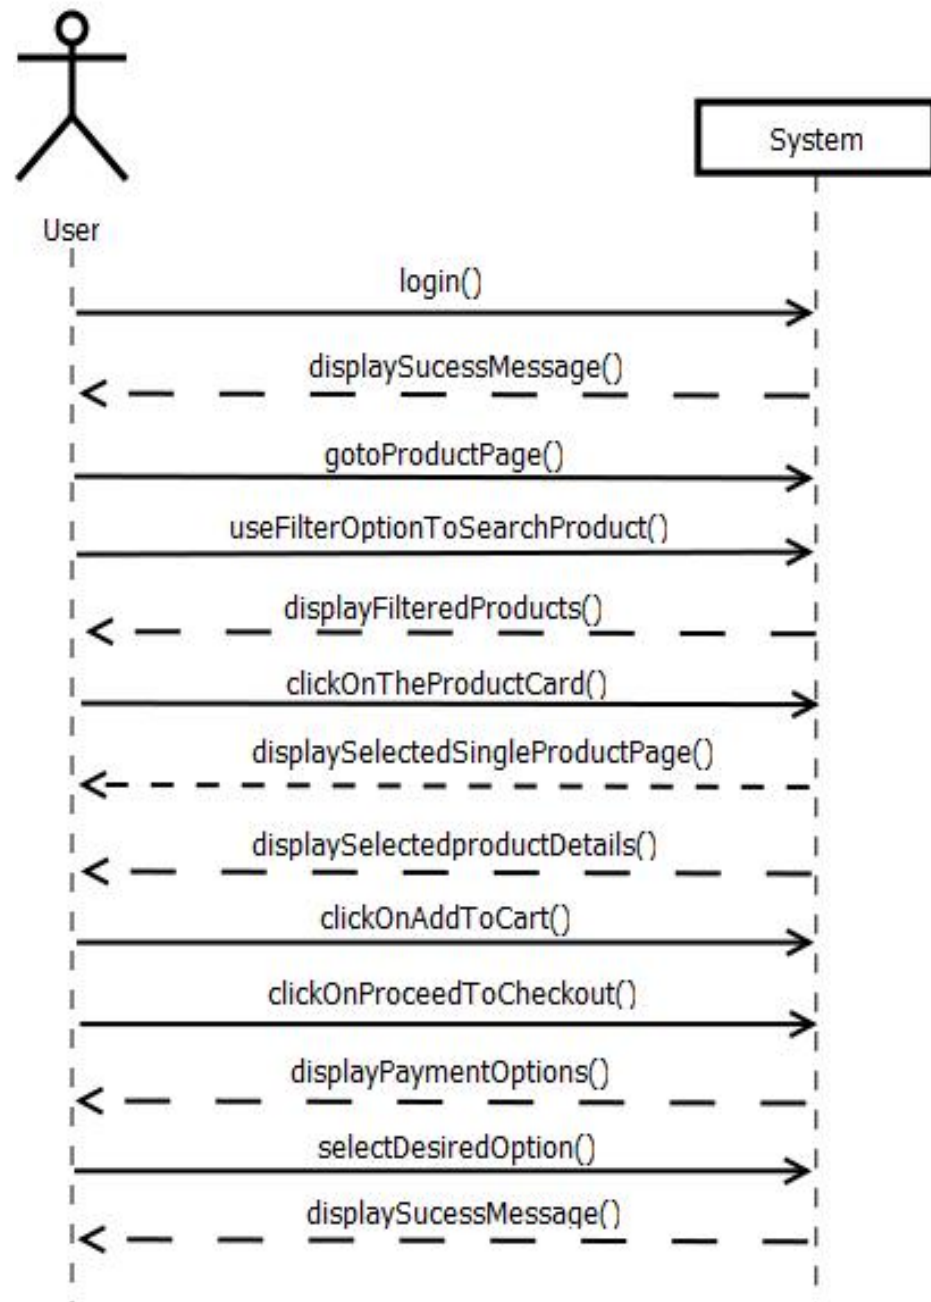

Figure 3.4.2.4: System Sequence Diagram for Product Filtering and Ordering

This diagram demonstrates the user's interaction with the system to filter products based on specific criteria (e.g., price, category) and proceed to the ordering process.

3.4.3 DESIGN CLASS DIAGRAM

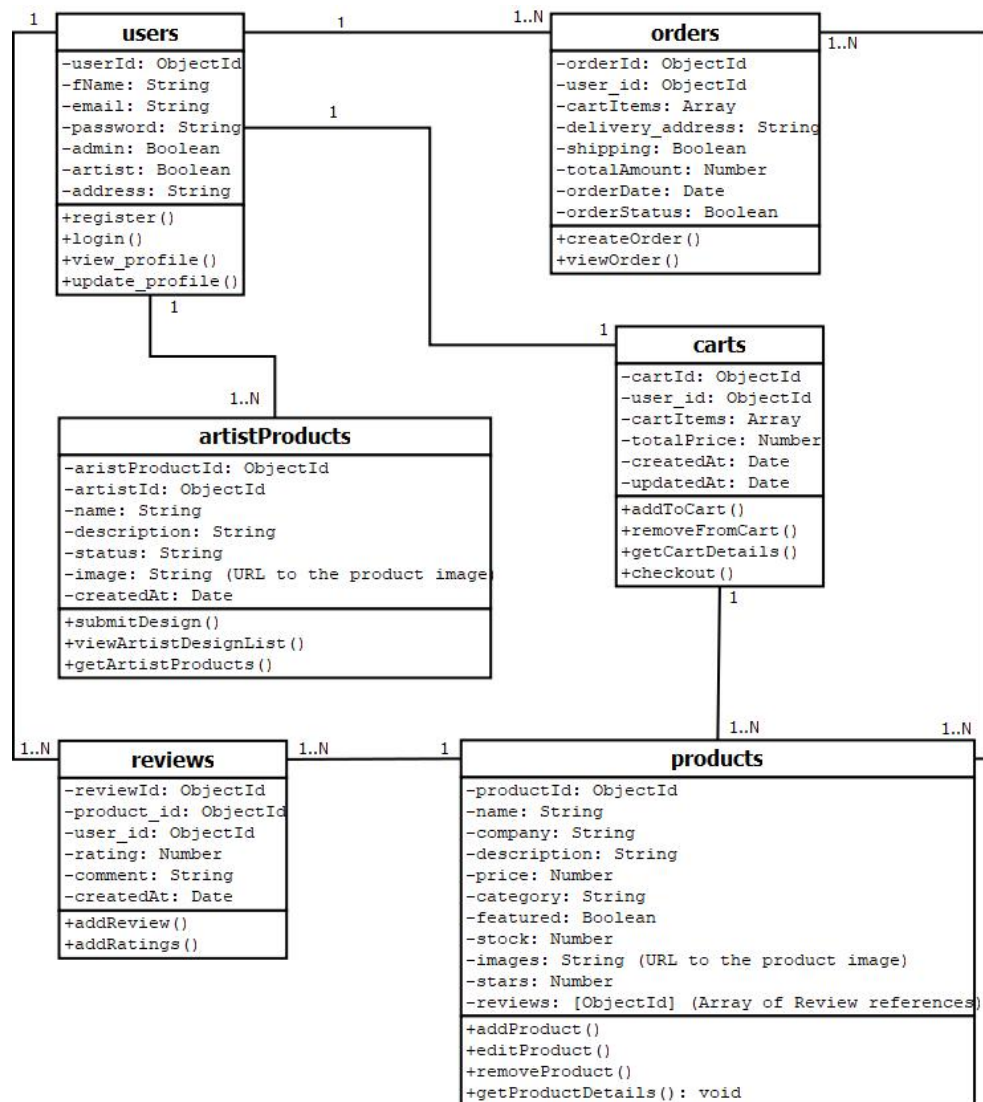

Figure 3.4.3.1: Design Class Diagram of MerchVault

The design class diagram provides an overview of the key classes within the MerchVault system, including products, users, orders, cart, etc. It also shows their attributes and relationships with each other.

3.4.4 INTERACTION DIAGRAM

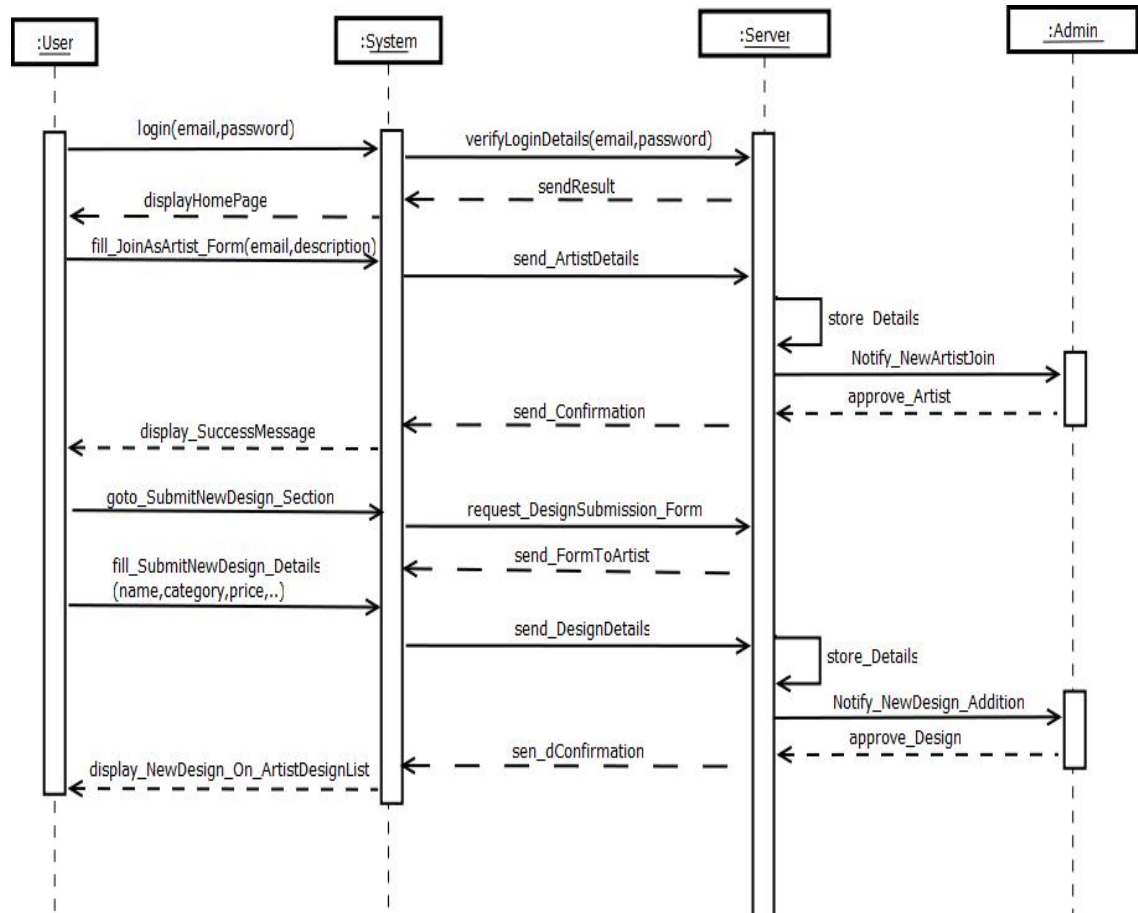

Figure 3.4.4.1: Interaction Diagram for New Design Submission of MerchVault

This interaction diagram shows how the system handles the process when a new design is submitted by an artist. It highlights the flow of messages between the artist, the system, and the admin.

CHAPTER 4

TEST CASES

4.1 SOFTWARE TESTING

Software testing is a process to evaluate the functionality of a software application with an intent to find whether the developed software met the specified requirements or not. It also identifies the defects to ensure that the product is defect-free in order to produce a quality product.

4.2 TEST OBJECTIVES

The main objectives of testing MerchVault were to:

- Check whether the web application is as per the requirements or not.
- Ensure defects get a fix from the developers before deployment.

4.3 TEST RESULTS

Table 4.3.1: Test Cases

SN	TEST CASES	EXPECTED	OBSERVED	RESULT
1	Sign Up as Artist	When a user signs up as an artist, the system should create an artist profile and notify the user with an email confirmation.	The system successfully creates an artist profile and sends an email confirmation.	Ok
2	Customize Product Graphics	The user should be able to customize product graphics by uploading their own design or selecting from pre-existing designs.	The user can upload or select designs and successfully customize the product.	Ok

3	Submit Product Graphics (Artist)	Artists should be able to submit their product designs with descriptions for approval by the admin.	Artists are able to submit product designs with descriptions, and they appear in the admin's approval list.	Ok
4	Give Product Rating/Review	The user should be able to rate and write a review for purchased products on the product page.	The user submits a rating and review, and it is saved in the database.	Ok
5	Add New Products (Admin)	The admin should be able to add new products by filling in details such as name, description, and upload product images.	The admin successfully adds new products, and they appear on the product page.	Ok
6	Search Product Functionality	The user should be able to search for products using the search bar.	The user successfully searches for products, and relevant results are displayed.	Ok

CHAPTER 5

CONCLUSION

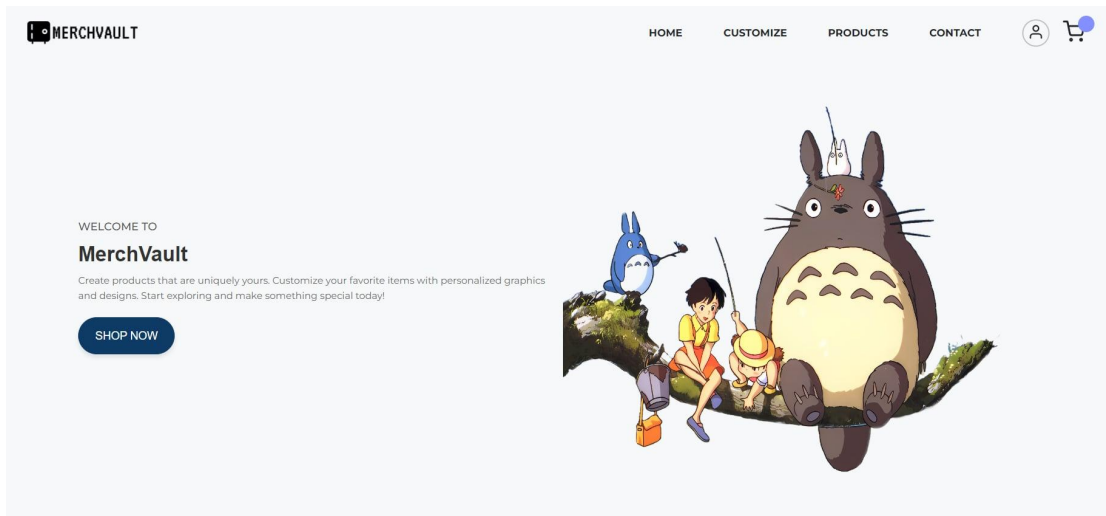

5.1 CONCLUSION

In summary, our project, MerchVault, is an e-commerce web application designed to provide users with a customizable shopping experience, allowing for easy creation and purchase of personalized products. The platform offers artists a space to showcase their designs while enabling customers to customize products like t-shirts, posters, and more with user-friendly tools. MerchVault connects artists, customers, and administrators, creating a seamless system for product customization, ordering, and management.

Appendix 8 : User Order List

Appendix 9 : Admin Dash Board

The screenshot shows a 'Submit New Design' form. At the top is a table with columns: Design Image, Product Name, Description, and Status. It contains two rows: 'New product 1' with image 'AAAS' and status 'Pending', and 'Poster 1' with image 'my design for poster' and status 'Pending'. Below the table is the 'Submit New Design' section. It includes an 'Upload Image:' area with a 'Choose File' button and a 'NO FILE CHOSEN' message. To the right are input fields for 'Product Name:' (with placeholder 'PRODUCT NAME') and 'Product Description:' (with placeholder 'PRODUCT DESCRIPTION'). A large dark blue 'Submit Your Design' button is at the bottom.

Design Image	Product Name	Description	Status
	New product 1	AAAS	Pending
	Poster 1	my design for poster	Pending
